

Amendments to the Abstract:

Please replace the abstract with the following amended abstract:

An In Plane Switching liquid crystal display (2) includes a first substrate (22), a second substrate (21), a liquid crystal layer, ~~a plurality of and~~ common electrodes (25) and pixel electrodes (26). ~~The first substrate and the second substrate substrates~~ are disposed oppositely and spaced apart, and with the liquid crystal layer [[is]] disposed therebetween. The common electrodes and the pixel electrodes are formed on the first substrate parallel to each other. ~~A plurality of conductive Conductive~~ spacers (29) [[is]] are formed on the common electrodes and the pixel electrodes, and are electrically connected to the common and pixel electrodes. Each conductive spacer includes a spacer rib having a form of a parallelepiped, and a conductive film deposited on all surfaces of the spacer rib. When a voltage is applied across the common electrode and the pixel electrode electrodes, an electric field substantially parallel to the ~~first substrate and the second substrate substrates~~ is generated between the conductive spacers on the common electrode and the pixel electrode electrodes. The In Plane Switching liquid crystal display has a high aperture ratio and a low driving voltage.
